

Exam PHYS 4A WINTER 2015 QUIZ 2 VERSION A

1 hour = 60 mins; 1 min = 60 secs. $g = 9.8 \text{ m s}^{-2}$

MULTIPLE CHOICE. Choose the one alternative that best completes the statement or answers the question.

1. A person is walking on a horizontal surface, pulling 2 blocks of mass 10 Kg and 8 Kg connected by ropes. He is pulling on the first block with a rope making 30° to the horizontal, while the rope between the 2 blocks is horizontal as shown in the figure. The blocks are accelerating at 2 m/s^2 and there is no slack in the ropes. The tensions in the ropes are T_1 and T_2 as indicated. Neglecting the friction between the blocks and the ground, the difference in the tension between the ropes ($T_1 - T_2$) is closest to:

- (A) 16.0 N (B) 25.6 N (C) -1.52 N (D) 36.0 N

2. An enemy ship starts sailing directly outwards from the base of a cliff 400 m high at a constant speed of 16 m/s. At the same instant a projectile is fired from the top of the cliff and hits the ship when it is 200 m away from the base of the cliff. Neglect air resistance. Closest to which angle to the horizontal was the projectile fired from the top of the cliff?

- (A) 83.2° (B) 75.3° (C) -63.4° (D) 61.3°

3. A man in a space suit with total mass 80 Kg steps outside his space ship to push away a block of debris of mass 600 Kg which is stationary with respect to the spaceship. Assuming he pushes it with a constant force of 100 N for 1 sec, how far apart will he and the block be 10 secs after he started pushing, if he does not use his thrust rocket?

- (A) 12.8 m (B) 16.6 m (C) 13.5 m (D) 14.1 m

4. An astronaut who weighs 725 N on earth goes to planet X, which has no atmosphere. She observes that when she drops a 2.35 Kg stone from rest on planet X, it takes 1.12s to fall a distance of 3.82 m. The astronaut's weight on planet X is closest to:

- (A) 225 N (B) 1167 N (C) 505 N (D) 451 N

As PER
VERSION A

QUIZ - 2 SOLUTIONS

PHYS 4A

1.) B

Considering both the blocks as our system,

and \vec{a} in x -direction is 2 m/s^2

$$\therefore M_{\text{Total}} a = F_{\text{total}} \quad (\text{applying in } x\text{-direction})$$

$$\Rightarrow T_1 \cos 30^\circ = (10+8) \cdot 2$$

$$\Rightarrow T_1 = \frac{36}{\cos 30^\circ} \text{ N}$$

$$\Rightarrow T_1 = \frac{72}{\sqrt{3}} \text{ N}$$

Now,

For the left block, T_2 is the only force acting in x -direction.

$$\therefore T_2 = 8 \times 2 \text{ m/s}^2$$

$$\Rightarrow T_2 = 16 \text{ N}$$

$$\therefore T_1 - T_2 = \frac{72}{\sqrt{3}} - 16 = 25.56 \text{ N}$$

$$\text{or } T_1 - T_2 \approx 25.6 \text{ N}$$

2.) C

Since ~~ball~~ projectile and enemy ship start off at same time,

$$v_x = \text{Speed of enemy ship} = 16 \text{ m/s}$$

{ as there is no acceleration in x -direction for Projectile }

$$t = \frac{d}{v_x} = \frac{200}{16} \text{ s}$$

$$\Rightarrow t = 12.5 \text{ s}$$

In this same time ~~the~~ projectile covers a distance of 400 m in y-direction,

\therefore ~~also~~ Using,

$$y = v_y t + \frac{1}{2} a t^2$$

$$\Rightarrow -400 = v_y (12.5) + \frac{1}{2} (-9.8) (12.5)^2$$

$$v_y = 29.25 \text{ m/s} \Rightarrow v_y = 29.25 \text{ m/s}$$

$$\therefore \tan \theta = \frac{v_y}{v_x}$$

$$\theta = \tan^{-1} \left(\frac{29.25}{16} \right)$$

$$\Rightarrow \theta = \underline{\underline{61.3^\circ}}$$

3.) c

$t = 0$

Both at rest. Man starts pushing the debris.

$t = 1\text{ s}$

Looses contact with the debris

$t = 10\text{ s}$

Between $t = 0$ & $t = 1\text{ s}$

$$a_M = \frac{100\text{ N}}{80\text{ kg}}$$

$$= \frac{5}{4}\text{ m/s}^2$$

$$a_D = \frac{100\text{ N}}{600\text{ kg}}$$

$$= \frac{1}{6}\text{ m/s}^2$$

$$\therefore d_M = \frac{1}{2} a_M t^2$$

$$= \frac{1}{2} \cdot \frac{5}{4} (1)^2$$

$$= \frac{5}{8}\text{ m}$$

$$\therefore d_D = \frac{1}{2} a_D t^2$$

$$= \frac{1}{2} \left(\frac{1}{6}\right) \times (1)^2$$

$$= \frac{1}{12}\text{ m}$$

$$\begin{aligned}
 v_M &= u_M + a_M t \\
 &= 0 + \frac{5}{4} \times 1 \\
 &= \frac{5}{4} \text{ m/s}
 \end{aligned}$$

$$\begin{aligned}
 v_D &= u_D + a_D t \\
 &= 0 + \frac{1}{6} \times 1 \\
 &= \frac{1}{6} \text{ m/s}
 \end{aligned}$$

\therefore At $t = 1 \text{ s}$

$$\begin{aligned}
 x_1 &= d_M + d_D = \frac{5}{8} + \frac{1}{12} \\
 &= \frac{17}{24} \text{ m}
 \end{aligned}$$

After $t = 1 \text{ s}$ till $t = 10 \text{ s}$, the force on man and debris is 0. \therefore acceleration is 0 for both of them.

Then, distance travelled by man & debris between $t = 1 \text{ s}$ and $t = 10 \text{ s}$ is

$$\begin{aligned}
 x_M &= v_M t \\
 &= \frac{5}{4} (9) \\
 &= \frac{45}{4} \text{ m}
 \end{aligned}$$

$$\begin{aligned}
 x_D &= v_D t \\
 &= \frac{1}{6} (9) \\
 &= \frac{3}{2} \text{ m}
 \end{aligned}$$

$$\begin{aligned}
 \therefore \left. \begin{array}{l} \text{Total separation} \\ \text{after } t = 10 \text{ s} \\ \text{(d}_{\text{total}}) \end{array} \right\} &= X_1 + (X_M + X_D) \\
 &= \frac{17}{24} + \frac{45}{4} + \frac{3}{2} \\
 &= 13.46 \\
 &\approx \underline{\underline{13.5 \text{ m}}}
 \end{aligned}$$

4.) D

on Planet X,

$$d = vt + \frac{1}{2} a_x t^2$$

~~3.82 = 0 + \frac{1}{2} (a_x) (1.12)^2~~

$$\Rightarrow -3.82 = 0 + \frac{1}{2} (a_x) (1.12)^2$$

$$\Rightarrow a_x = -6.09 \text{ m/s}^2$$

↑
acceleration due to gravity
on Planet X.

{ Negative because it
is in downwards
direction }

$$\begin{aligned}
 \text{Mass of astronaut} &= \frac{725 \text{ N}}{g} = \frac{725 \text{ N}}{9.8 \text{ m/s}^2} \\
 (M_A) &= 73.98 \text{ kg}
 \end{aligned}$$

$$\begin{aligned}
 \therefore \left. \begin{array}{l} \text{Weight of astronaut on} \\ \text{Planet X} \end{array} \right\} &= M_A a_x \\
 &= 73.98 \times 6.09 \\
 &= 450.54 \\
 &\approx \underline{\underline{451 \text{ N}}}
 \end{aligned}$$
